

WHAT IS CLAIMED IS:

1 1. A method of operating a system to process image data,
2 the method comprising:
3 encoding said image data to generate first
4 encoded image data;
5 decoding said first encoded image data to
6 generate first decoded image data;
7 analyzing the content of the first decoded image
8 data to generate indexing information; and
9 storing the first encoded image data with the
10 generated indexing information on a digital storage medium.

1 2. The method of claim 1, wherein the previously
2 generated indexing information is a first set of indexing
3 information, the method further comprising:
4 retrieving the stored first encoded image data
5 from the digital data storage device;
6 decoding said first encoded image data for a
7 second time to generate decoded image data;
8 analyzing the content of the first decoded image
9 data to generate a second set of indexing information; and
10 storing the second set of indexing information
11 with the first encoded image data and the previously
12 generated indexing information on the digital storage
13 media.

1 3. The method of claim 2, further comprising:

retrieving the stored first encoded image data
for a second time;
decoding said first encoded image data for a
third time to generate decoded image data;
analyzing the content of the first decoded image
data to generate a third set of indexing information; and
storing the third set of indexing information
with the first encoded image data, and the first and second
sets of indexing information on the digital storage media.

4. The method of claim 1, further comprising:

receiving image data information relating to said
image data prior to performing said encoding step; and
storing, on the digital storage media, the
received image data information with the first encoded
image data and the generated indexing information.

5. The method of claim 4, wherein the received image data
information, first encoded image data, and the generated
indexing information are stored together in a first file on
the digital storage media.

6. The method of claim 5, wherein the digital storage
media further includes:

a second file which includes second encoded image
data, second generated indexing information and second
received image data; and

a file directory, the file directory including:

a copy of said generated indexing
information included in the first file; and

9 a copy of the second generated indexing
10 information included in the second file.

1 7. A data processing method, the method comprising:
2 receiving a first set of encoded data;
3 decoding the first set of encoded data to
4 generate first decoded data;
5 analyzing the content of the first decoded data
6 to generate first indexing information; and
7 storing the first set of encoded data with the
8 first indexing information in a first file on a digital
9 storage medium.

1 8. The method of claim 7, further comprising the step of:
2 receiving a second set of encoded data;
3 decoding the second set of encoded data to
4 generate second decoded data;
5 analyzing the content of the second decoded data
6 to generate second indexing information; and
7 storing the second set of encoded data with the
8 second indexing information in a second file on the digital
9 storage medium.

1 9. The method of claim 8, further comprising:
2 storing in a directory file on the digital
3 storage medium a copy of the first indexing information and
4 a copy of the second indexing information.

1 10. The method of claim 9, further comprising the step of:
2 retrieving the first set of encoded data from the
3 digital storage medium;

4 decoding the first set of encoded data for a
5 second time to generate third decoded data;
6 analyzing the content of the third decoded data
7 to generate a third set of indexing information; and
8 storing the third set of indexing information in
9 a file on the digital storage medium with the first set of
10 encoded data and the first indexing information.

1 11. The method of claim 10, further comprising the step
2 of:

3 adding a copy of the third set of indexing
4 information to the directory file on the digital storage
5 medium.

1 12. The method of claim 11, further comprising:

2 retrieving the first set of encoded data from the
3 digital storage medium for a second time;

4 decoding the first set of encoded data for a
5 third time to generate fourth decoded data;

6 analyzing the content of the fourth decoded data
7 to generate a fourth set of indexing information; and

8 storing the fourth set of indexing information in
9 a file on the digital storage medium with the first set of
10 encoded data, the first indexing information, and the third
11 set of indexing information.

1 13. The method of claim 12, further comprising:

2 adding a copy of the fourth set of indexing
3 information to the directory file on the digital storage
4 medium.

1 14. The method of claim 10, wherein the step of analyzing
2 the content of the third decoded data includes:

3 analyzing the third decoded data for at least
4 some information which is different than the information
5 for which the first decoded data was analyzed.

1 15. The method of claim 12,

2 wherein the step of analyzing the content of the
3 third decoded data includes:

4 analyzing the third decoded data for at
5 least some information which is different than
6 the information for which the first decoded data
7 was analyzed; and

8 wherein the step of analyzing the content of the
9 fourth decoded data includes:

10 analyzing the fourth decoded data for at
11 least some information which is different than
12 the information for which the first and third
13 decoded data was analyzed.

1 16. The method of claim 15, wherein the first set of
2 encoded data includes at least one of encoded audio data
3 and encoded video data.

1 17. The method of claim 9, further comprising the step of:

2 receiving search information from a system user;

3 accessing the directory file to identify stored

4 encoded data corresponding to the received search

5 information; and

6 retrieving from the digital storage medium
7 encoded data identified as corresponding to the received
8 search information.

1 18. The method of claim 17, further comprising the step
2 of:

3 converting the retrieved encoded data from a
4 first encoding format to a second encoding format thereby
5 generating data encoded according to the second encoding
6 format, the second encoding format being different from the
7 first encoding format; and

8 supplying the data encoded according to the
9 second encoding format to a data distribution system.

1 19. The method of claim 18, further comprising the step
2 of:

3 converting the retrieved encoded data from the
4 first encoding format to a third encoding format thereby
5 generating data encoded according to the third encoding
6 format, the third encoding format being different from the
7 first and second encoding formats; and

8 supplying the data encoded according to the third
9 encoding format to the data distribution system.

1 20. An apparatus for indexing encoded data including at
2 least one of encoded audio data and encoded image data, the
3 apparatus comprising:

4 a decoder module for decoding the encoded data to
5 generate first decoded data;

an indexing module for performing content analysis on the decoded data to generate information content indexing information; and

a storage device for storing the generated information content indexing information in a file with the encoded data.

21. The apparatus of claim 20, further comprising:

a retrieval module for retrieving from the storage device the encoded data included in the first file and for supplying the retrieved encoded data to the decoder module;

wherein the indexing module indexes decoded data generated by decoding the retrieved encoded data to produce second information content information, the second information content indexing information including information on different features than the previously generated information content indexing information; and

means for appending the second information content indexing information to the file including the retrieved encoded data.

22. The apparatus of claim 21, further comprising:

means for storing a copy of the indexing information included in said file with the encoded data in a file directory stored in the same storage device as the file including the encoded data.

23. The apparatus of claim 22, wherein the information content indexing information identifies physical objects included in images represented by said encoded data.

1 24. The apparatus of claim 23, wherein the information
2 content indexing information identifies words included in
3 songs stored using said encoded data.

1 25. A digital data storage device, comprising:
2 a plurality of data files, each data file
3 including index information and at least one of encoded
4 image data and encoded audio data; and
5 a file directory, the file directory including a
6 copy of the index information included in each one of the
7 plurality of data files.

1 26. The digital data storage device of claim 25,
2 wherein each of said plurality of data files
3 includes encoded image data and wherein said index
4 information included in each data field includes image
5 content information.

1 27. The digital data storage device of claim 26, wherein
2 the image content information in at least some of the
3 plurality of data files includes image content information
4 added to the data file after the initial creation of the
5 data file.

1 28. The digital data storage device of claim 27, the
2 encoded image data included in said plurality of data files
3 is encoded using a plurality of different image encoding
4 formats, the encoded image data in each particular data
5 file being encoded according to a single image encoding
6 format.

1 29. The digital data storage device of claim 28, wherein
2 the plurality of different image encoding formats are
3 encoding formats for which public standards exist.

1 30. The digital data storage device of claim 29, wherein
2 the plurality of different image encoding formats include
3 MPEG-2, JPEG and DV.

1 31. The digital data storage device of claim 29, wherein
2 the index information included in each of the plurality of
3 data files is encoded according to the same encoding
4 format.

1 32. The digital data storage device of claim 31, wherein
2 the format used to encode said index information is not a
3 public standards based encoding format.

1 33. The digital data storage device of claim 31, wherein
2 the index information is included in each data file in a
3 manner that results in the index information being
4 discarded when processed by a decoder which does not
5 support decoding of the format used to encode said index
6 information.

1 34. A method of processing an encoded data file, the
2 method comprising the step of:
3 searching the encoded data file for content
4 information which can be obtained by examining encoded data
5 included in said file without fully decoding said encoded
6 data;

7 retrieving from the data file encoded data
8 satisfying a set of search criteria; and
9 fully decoding the retrieved encoded data.

1 35. The method of claim 34, wherein the step of searching
2 the encoded data file includes the step of:
3 performing a variable length decoding operation
4 to produce data including DCT coefficients;
5 examining the DCT coefficients to determine if
6 the search criteria are satisfied.

1 36. The method of claim 35, wherein the step of retrieving
2 from the data file encoded data includes:
3 retrieving one but not all of a plurality of
4 encoded data streams included in said encoded data file.

1 37. The method of claim 36, wherein the step of retrieving
2 from the data file encoded data includes:
3 retrieving some but not all of the encoded data
4 included in an encoded data stream.

1 38. The method of claim 34, further comprising the step
2 of:
3 performing an indexing operation on the decoded
4 data produced by decoding the retrieved encoded data to
5 thereby generate indexing information; and
6 storing the indexing information in the data file
7 from which the encoded data was retrieved.

1 39. A method of indexing encoded information, the method
2 comprising the steps of:

3 retrieving encoded information from a data file;
4 performing a partial decoding operation on the
5 encoded information to generate partially decoded data; and
6 performing an indexing operation on said
7 partially decoded data to generate indexing information.

1 40. The method of claim 39, further comprising the step
2 of:

3 storing the generated indexing information in the data
4 file from which the encoded information was retrieved.

1 41. The method of claim 39, wherein the step of performing
2 a partial decoding operation includes the step of:

3 performing a decoding operation to generate DCT
4 coefficients from the encoded data; and

5 wherein the step of performing an indexing
6 operation includes examining the DCT coefficients to assess
7 the information content of the retrieved encoded data.

1 42. The method of claim 40, wherein the step of storing
2 the generated indexing information includes appending the
3 indexing information to said data file.

1 43. The method of claim 39, wherein the step of retrieving
2 encoded information includes:

3 retrieving one but not all of a plurality of
4 encoded data streams included in said encoded data file.

1 44. The method of claim 39, wherein the step of
2 retrieving from the data file encoded data includes:

- 3 retrieving some but not all of the encoded data
- 4 included in an encoded data stream.
